QbCheck

Transforming ADHD care with QbCheck

Clear data for faster decisions and more confident care, in clinic or remote.

Our **all-in-one solution** is the only to measure **all three ADHD symptoms** in the DSM-5. Our technology tracks motor activity with **1mm precision**, giving an objective view of even the smallest activity patterns.

Why Objective Testing Matters

Traditional evaluations alone can't keep up with today's diagnostic pressures. Objective testing is rapidly becoming the gold standard, helping to reduce delays and recognize complex presentations earlier in the clinical process. With our technology, you can deliver **confident**, **compliant**, and **consistent** ADHD evaluations for every patient.

Those improving their services now can reduce waitlists and deliver faster access to care.

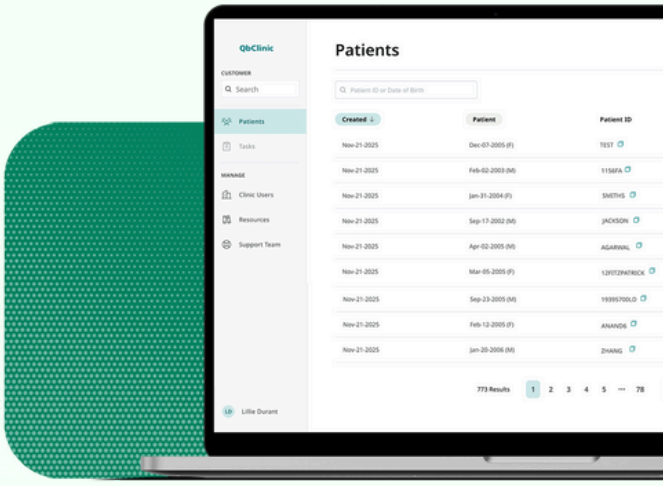

90%
faster diagnostic-to-treatment pathways
compared to traditional workflows[1]

12x
clinic capacity growth
during a full-service transformation, utilizing QbCheck[2]

56%
more ADHD assessments delivered
1.5 years after implementation[3]

Why Leading Organizations Choose Qbtech

- **Trusted globally:** Over 1 million patients tested in 18 countries
- **Easy-to-interpret reports:** Simple, visual reports to support clinical diagnoses and patient conversations
- **Clinically validated:** Over 20 years of research and real-world evidence, FDA-cleared and CE-marked
- **Full support:** Clinical training, technical support, and payor reimbursement
- **Objective and scalable:** Supports remote and in-person clinics of all sizes
- **Clinician and patient-facing portals:** Track your patient's progress and assign tasks, including to their families and teachers

1. This section provides an ADHD Total Symptom Score and Level, indicating if the patient presents with typical ADHD symptoms and how this corresponds to the approx. prevalence of ADHD symptoms in the general population.

2. These graphs show the patient's activity levels, attention and impulse control, and if / how these changed over time. Green reflects a correct and red an incorrect response, while a black bar reflects a non-response to a target.

3. This section shows you, in scores, how the patient performed compared to their norm group on activity, impulsivity and inattention.

   This information helps to establish if and to what extent they resemble or deviate from their peers.

4. These graphs represent an age and gender matched individual without a clinical diagnosis of ADHD.

   By comparing the patient's graphs to the Sample Case you can see how similar or different they performed compared to a peer.
